Introduction	1
Problem description	1
Objectives and aims of the study	3
1. Theoretical background to dry ecosystems	7
1.1. Dynamics of dry ecosystems: ephemeral versus permanent changes	7
1.1.1. Brief characterization of ecosystems in dry regions	7
1.1.2. Dynamics of ecosystems in drylands	8
1.2. Remote sensing based investigations of vegetation changes and their explanatory factors	11
2. Study area	15
2.1. Geographical location and mean characteristics	15
2.2. Climate conditions	15
2.3. Soils	17
2.4. Vegetation	20
2.5. Land use	24
2.6. Change in land use practices	25
2.7. Problem of land degradation in Central Asia	29
3. Data used in the study and their preprocessing	31
3.1. Climate data and their preparation	31
3.1.1. Climate records	31
3.1.2. Preparation of gridded climate maps	31
3.2. Satellite data	33
3.2.1. Data of coarse spatial resolution	33
3.2.2. Data of fine spatial resolution	35
3.3. Digital terrain model	36
3.5. Agrarian and population statistics	37
3.6. Field data	37
4. Methodology of data analysis	39
4.1. Analysis of vegetation distribution, variability and change in space and time	39
4.1.1. Simple methods of descriptive statistic	39
4.1.2. Calculation of time-trends	39
4.2. Methods of geostatistical analysis	40
4.2.1. Autocorrelation	40
4.2.2. Spatial autocorrelation	40
4.2.3. Kriging with an external drift	41
4.3. Analysis of the relationship between vegetation change and its explanatory factors	42
4.3.1. Correlation coefficient	42
4.3.2. Multiple correlation coefficient	43
4.3.3. Partial correlation coefficient	43

4.4. Modelling relationship between vegetation patterns and explanatory factors	44
4.4.1. Simple linear regression model	44
4.4.2. Multiple linear regression model	44
4.4.3. Problem of non-stationarity by analysing spatial relationship	45
4.4.4. Moving window regression	46
4.4.5. Geographically weighted regression	46
4.5. Assessment of modelling accuracy	50
4.5.1. Root Mean Square Error (RMSE)	50
4.5.2. Standard error	51
4.5.3. Spatial autocorrelation for accuracy assessment	51
4.6. Evaluation of land cover change and its driving forces	52
4.6.1. Background for discrimination between climate-induced and human-induced vegetation change	52
4.6.2. Identification of climate and anthropogenic signals in the vegetation time-series	53
4.6.3. Analysis of regression residuals for identification of areas experiencing anthropogenic impact	54
5. Analysis of climatic conditions	57
5.1. Network of climate stations in the study region	57
5.2. Modelling spatial patterns in climate parameters	59
5.3. Statistical analysis of climate data.	61
5.3.1. The inter-annual variability of precipitation and temperature.	61
5.3.2. Trends in climatic parameters	63
5.4. Discussion and conclusion	65
6. Within-season dynamics of vegetation activity and their relationship to climate factors	71
6.1. Spatial distribution of Normalized Difference Vegetation Index (NDVI) and climatic factors in the study area	71
6.2. Average characteristics of NDVI	71
6.3. Temporal behaviour of climatic factors and vegetation within the growing season	72
6.4.1. Stratification of NDVI-precipitation relationship by land cover type	77
6.4.2. Stratification of NDVI-precipitation relationship by vegetation communities	79
6.5. Within-season relationship between NDVI and temperature	80
6.6. Spatial patterns in NDVI-climate relationship	82
6.7. Inter-annual variations in within-season NDVI-climate relationship	84
6.8. Discussion and conclusion	86
7. Inter-annual change in vegetation activity and its relation to climate	87
7.1. Patterns in monthly time-series 1982-2001	88
7.2. Inter-annual relationship between NDVI and climatic parameters	89
7.2.1. Analysis of spatially averaged NDVI versus precipitation	89

7.2.2. Relationship between spatially averaged NDVI and temperature.	92
7.2.3. Spatial patterns in inter-annual NDVI-climate relationship	95
7.3. Quantifying temporal variability in vegetation conditions	97
7.3.1. Standard deviation of NDVI	97
7.3.2. Variance of NDVI values over the study period	99
7.3.3. Dependence of $NDVI_{cv}$ on the relief	101
7.4. Discussion and conclusion	106
8. Spatial response of vegetation cover to climatic factors	109
8.1. Growing season relationship between NDVI and precipitation	109
8.1.1. NDVI-rainfall correlation coefficients	109
8.1.2. NDVI-rainfall relationships by vegetation type	110
8.1.3. Influence of growing season rainfall on NDVI-rainfall correlation	113
8.1.4. Spatial patterns in NDVI anomalies and their relationship to rainfall	113
8.2. Within-season relations between NDVI and rainfall	116
8.2.1. Spatial patterns in intra-annual dynamic of NDVI and climate parameters	116
8.2.2. Within-season NDVI-rainfall correlation coefficients	119
8.2.3. Influence of vegetation type on within-season relations between NDVI and rainfall	123
8.2.4. Influence of precipitation amount on NDVI-rainfall relations	127
8.3. Growing season relationship between temperature and NDVI	131
8.3.1. NDVI-temperature correlation coefficients	131
8.3.2. NDVI-temperature correlation coefficients by vegetation type	131
8.3.3. Influence of annual rainfall on NDVI-temperature correlation	132
8.4. Within-season relationship between NDVI and temperature	135
8.4.1. General patterns in the NDVI-temperature correlation	135
8.4.2. Influence of cover types on within-season relationship between NDVI and temperature	135
8.5 Discussion and conclusion	136
9. Application of the geographically weighted regression to modelling relationship between vegetation patterns and climate factors	139
9.1. Problem of non-stationarity in modelling spatial relationship and approaches to overcome it	139
9.2. Reducing uncertainty in modelling NDVI-precipitation relationship: a comparison between OLS and GWR regression techniques	141
9.2.1. Global OLS regression model and its deficiencies	141
9.2.2. Stratification of NDVI-precipitation relationship by land cover type	143
9.2.3. Local variability in relationship between vegetation and precipitation	145
9.2.4. Analysis of regression residuals	148

9.3. Analysis of temporal variations in NDVI-precipitation relationship using GWR	150
9.3.1. Variations in the relationship strength	151
9.3.2. Trends in NDVI-rainfall relationship and their linkages to land use/land cover change	152
9.4. Discussion and conclusion	155
10. Detection of climate-induced and human-induced vegetation change	159
10.1. Trends in spatially averaged NDVI	160
10.1.1. Trends in growing season NDVI	160
10.1.2. Trends in seasonal NDVI	161
10.2. Spatial patterns of NDVI trends	162
10.3. Effects of precipitation and temperature on NDVI trends	164
10.3.1. Effects of climate on changes in spatially averaged NDVI	164
10.3.2. Spatial patterns in climate effects on NDVI trends	166
10.4. Vegetation changes which are not explained by climate	169
10.4.1. Spatial patterns in NDVI trends not explained by rainfall and temperature	169
10.4.2. Verification of results and explanation of trends induced by non-climatic factors	170
10.5. Human-induced change in vegetation cover in areas without significant NDVI trends	175
10.5.1. General approach	175
10.5.2. Implementation of the suitable regression models for identification of the climatic signal	176
10.5.3. Modelling the climatic signal in the inter-annual NDVI time series	182
10.5.4. Identification of areas experiencing human-induced vegetation change	184
10.6. Discussion and conclusion	187
11. Summary	191
